

We are **often** asked to send a **comparison table** highlighting the technical differences between **SELEA cameras** and those of **other brands** on the market.

And there is a reason.

Even the most experienced people in the field of licence plate reading **have difficulty** understanding the real differences between one product and another, on the basis of the technical characteristics described in the products datasheets.

The only way to understand the difference between a product of one brand and another is to **compare the real images** on the road and the related vehicle recognition **data** (number plate, make, model, colour etc.) in **critical conditions** - such as dirty, deteriorated, half-covered number plates, etc. - **especially at night.**

What we show you in this document are the performances offered by SELEA access control cameras.

COMPARING CAMERAS

CRITICAL CONDITIONS

It is easy to read clean number plates in summer in broad daylight. It is much more difficult **at night**, especially **in winter** when the plates are dirty and in complete darkness. The matter becomes more complicated if the plates are also deteriorated, deformed or half-hidden. it is precisely when faced with such **critical conditions** that the real **differences between one brand of camera and another** become clear and evident.

That is why for us PRECISION IS EVERYTHING.

WE WANT TO PROVE IT TO YOU,

through images that are worth more than 1000 words.

DIRTY PLATE
